SmartBooks: An Online Bookstore System

Ahmed Ramy [redacted] (Leader) , ahmed amr sayed [redacted], Ramez Mokbil Iskander [redacted], Seifeldin Tarek Mohamed [redacted], Saifeleslam Saadeldin Ali Saadeldin [redacted]

Dialogue:

Analyst: Could you explain the main purpose of your online bookstore system?

Client: I want customers to be able to browse, shop, and pay for books securely online, while admins manage the catalogue and inventory.

Analyst: Should customers have their own accounts? What actions should they be able to perform there?

Client: Yes, they should be able to create accounts, edit their details, and use them to manage orders.

Analyst: How should customers search for books inside the system?

Client: They should be able to search by title, author, genre, or rating.

Analyst: What kind of shopping process do you want to implement?

Client: Customers should be able to add books to a cart, place orders, and pay directly online.

Analyst: Should customers be able to track their orders?

Client: Yes, they should get real-time status updates and notifications.

Analyst: What administrative functions are needed?

Client: Admins should be able to manage stock, suppliers, and overall inventory.

Analyst: Do you have preferences for how the website should look and feel?

Client: It should be modern, responsive, and easy to use on both desktop and mobile devices.

Analyst: What are your expectations about performance during peak sales?

Client: The system should handle thousands of users at the same time with no crashes.

Analyst: What security standards are required?

Client: Payments and user data must be encrypted. I'd also prefer two-factor login for customer accounts.

Analyst: How about availability and growth?

Client: The bookstore must have robust disaster recovery and scale easily with more books, users, and transactions, while keeping order tracking reliable.

2 Extracting Requirements:

2.1 Functional Requirements (What the system should do)

- Customers can create accounts and edit details.
- Customers can browse and search books by title, author, genre or rating.
- Customers can add books to cart, place orders, and pay online.
- Customers can track orders and receive updates.
- Admins can manage stock, suppliers, and inventory.

2.2 Non-Functional Requirements (How the system should behave)

- Usability: Modern, responsive, and user-friendly interface (desktop + mobile).
- Performance: Handle thousands of concurrent users during peak sales.
- Security: Secure transactions, encrypted sensitive data, two-factor login.
- Availability: robust disaster recovery.
- Reliability: Order tracking and accurate stock management.

3 Interview summary:
Interview Summary:

The interview revealed that the client requires an online bookstore system that allows customers to create and manage accounts, browse and search books by different criteria, add items to a shopping cart, place orders, pay securely online, and track order status with notifications. Administrators must be able to manage stock, suppliers, and inventory. The system should feature a modern, responsive interface accessible on both desktop and mobile, handle thousands of users simultaneously without crashing, secure sensitive data with encryption and two-factor authentication, include robust disaster recovery, and maintain reliable order tracking and stock accuracy.
